LFN 2020 April Virtual Conference

23<sup>rd</sup> April 2020

# VNF/CNF from factory to production – Enabled by OVP

<https://wiki.onap.org/display/DW/OVP+Introduction>

# Vendor's & Operator's Needs of the moment

## Certification (Badging) Time

- ✦ **Vendor** wants to get certification for VNFs (TOSCA & HEAT) , **CNF (helm)** by compliance, verification, validation and performance
- ✦ OVP needs a platform to **orchestrate test cases across different tools** and submit result to OVP portal for badging

## Design Time

- ✦ **Operator** wants to check the Operator's specific **VSP compliance check** when VNF is on-boarded in **SDC**
- ✦ **Operator** wants to **design the service testing**, similar to service design to enable service verification at run-time

## Run Time

- ✦ On every service instantiation, **operators** want to verify the network service before activating for the consumer. (**passive testing**) thru **SO/VFC**
- ✦ **Operators** want to check the SLA of service on need basis (**active testing**)

OVP

ONAP

# VNF Test Platform (VTP)

PERSONAS

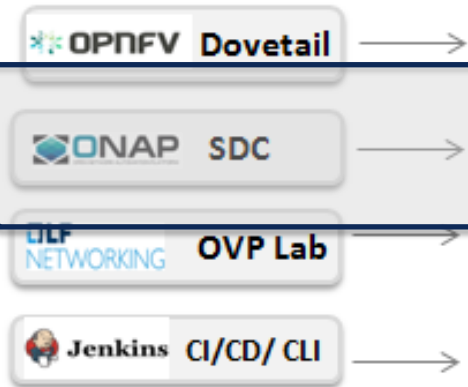

PARTNERS / LABs

Operator

Vendor

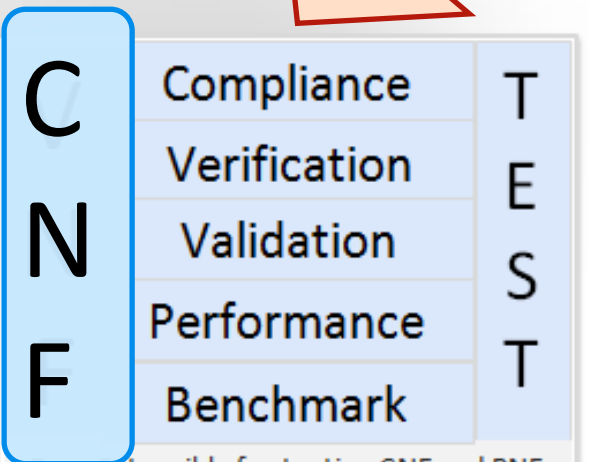

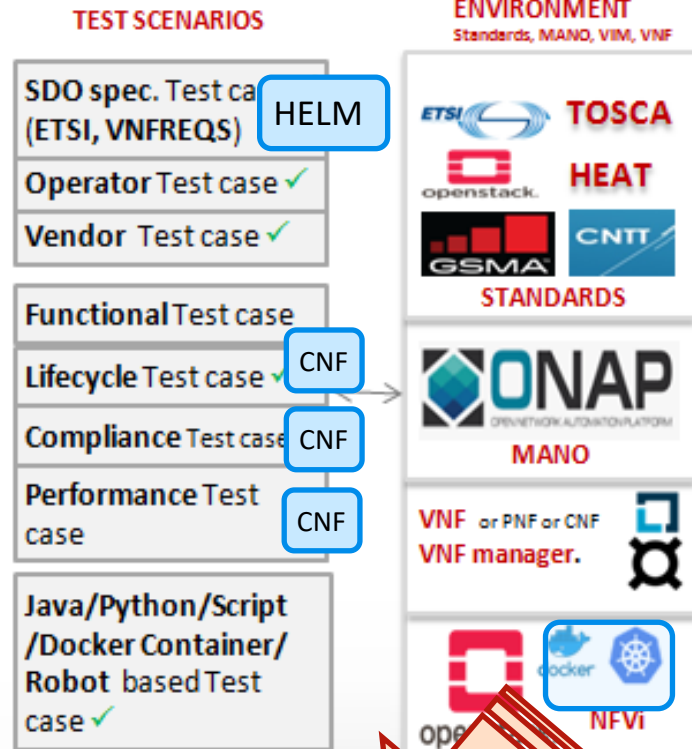

A **Test orchestration agile platform** to manage and orchestrate different VNF testing scenario across different SUT environment like ONAP MANO, OpenStack Cloud, Vendor VNF, SDN Controller, Kubernetes docker, etc under one umbrella across different Test providers and partner labs.

- |   |   |
|---|---|
| <b>Programming Interface</b><br>✓ Provides REST API over HTTP(s)<br>✓ Role-based Access control | <b>User Interface</b><br>✓ Web Portal<br>✓ Command Line Interface (CLI) |
|---|---|

**AGILE** Test case **Modeling & Standardization**  
 Test case management  
 Test **orchestration**  
 System Under Test (SUT) management

Artifacts, Test case, profiles, results

\*\*\* VTP REST API is standardized with TMF TestAPI (in progress) \*\*\*

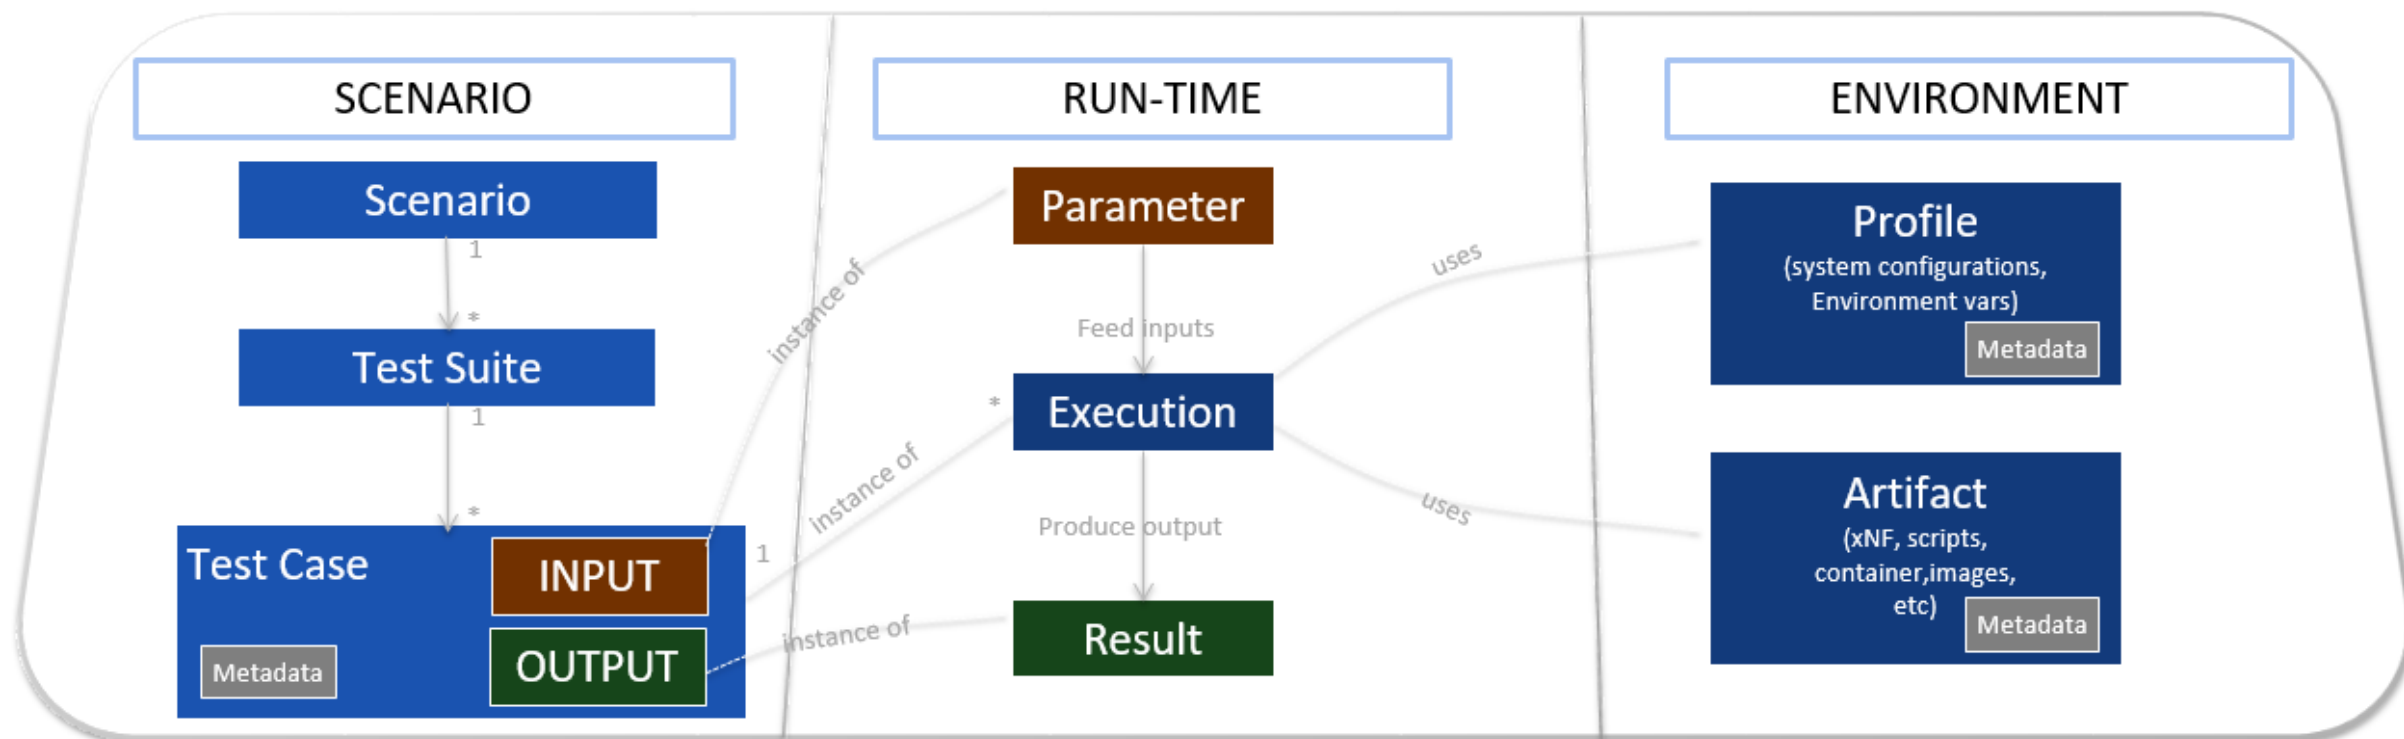

THE **LINUX** FOUNDATION

-- Powered by **Open Command Platform (OCOMP)** - Agile orchestrator, part of ONAP CLI project

- Easy Extensible for testing CNF and PNF-

# VTP: Domain model

✓ **Scenario** is an logical entity to model any given situations for which test cases are made, ex: LFN OVP, vendor specific, functionality specific.

✓ **Test suites** is an logical entity helps to group the tests into hierarchy with the notation x.y.z.

✓ **Test case** models the given real test case with required Inputs and Outputs.

✓ **Execution** models every execution of given test case with unique identifier

✓ **Parameter** is instance of Test case inputs, given by user while executing the test case

✓ **Result** is instance of Test case output, produced by VTP as part of Execution

✓ While execution, user could use Profile and Artifacts

✓ **Profile** models the System configurations and Pre-defined test case parameters. Ex: GSMA profile, OpenStack environment details, etc

✓ **Artifact** models the given binaries of any nature like VNF, Scripts, configuration files, certificates, etc

✓ **Metadata** models tagging to support searching of test execution

✓ Test case *results* are **searchable** based on artifact, profile, scenario, test-case, metadata as VTP captures every test case execution with parameters and results.

# VTP: Domain model

SCENARIO

RUN-TIME

ENVIRONMENT

## OVP:

Can I design, [id]entify & manage test case(s) ?

Can I tag and filter test cases for given CNTT RC[1,2] requirements ?

Can I store results and search ?

Can I mark test case as MUST, SHOULD, OPTIONAL, etc?

I don't want to worry about my test native result format, but Can I submit my results in OVP format ?

Can I integrate and collaborate with different test tools from OPNFV, CNCF, ONAP, OpenStack ?

## ONAP:

Can I verify my VNF while on-boarding to check for my Operator specific reqs?

Can I make it to verify VNF fn. before activating for user?

Can I make it to check my network service current status ?

Profile

(system configurations)

Yes You Can!

✓S  
for  
fun  
✓T  
hier  
✓T

Inputs and Outputs.

✓While execution, user could use Profile and Artifacts

execution

Defined test case parameters. Ex: OSM/A profile, OpenStack environment details, etc  
**Artifact** models the given binaries of any nature like Scripts, configuration files, certificates, etc  
**Metadata** models tagging to support searching of test

✓Test case *results* are **searchable** based on artifact, profile, scenario, test-case, metadata as VTP captures every test case execution with parameters and results.

Service Test

# ONAP : Network Service Test (CNF)

# VNF Test Platform (VTP) – 3<sup>rd</sup> Party Test tool integration – ONAP G release

**VTP** provides profile feature to integrate any 3<sup>rd</sup> party tool and leverage the test cases from those tools without re-implementing them. And each profile is made 3 parts as given below:

1. **Auto Discover** – Discovers the available test cases in test tool and produces Test case YAML
2. **Auto Register** – Register those discovered YAML into VTP as test cases
3. **Executor** – Execute the given test cases by using the corresponding test tool

Note: Currently VTP has implemented these features for OVP, ONAP

Thank you
