vFirewall CNF Use Case

Source files

- Heat/Helm/CDS models: [vFW_CNF_CDS Model](#)
- Automation Scripts: [vFW_CNF_CDS Automation](#)

Description

This use case is a combination of [vFW CDS Dublin](#) and [vFW EDGEX K8S](#) use cases. The aim is to continue improving Kubernetes based Network Functions. This use case is a continuation of [vFW CDS Dublin](#) left and brings CDS support into picture like [vFW CDS Dublin](#) did for the old vFW Use case. Predecessor use case is also documented in [vFW Use Case](#).

This use case shows how to onboard helm packages and to instantiate them with help of ONAP. Following improvements were made in the vFW CNF Use Case:

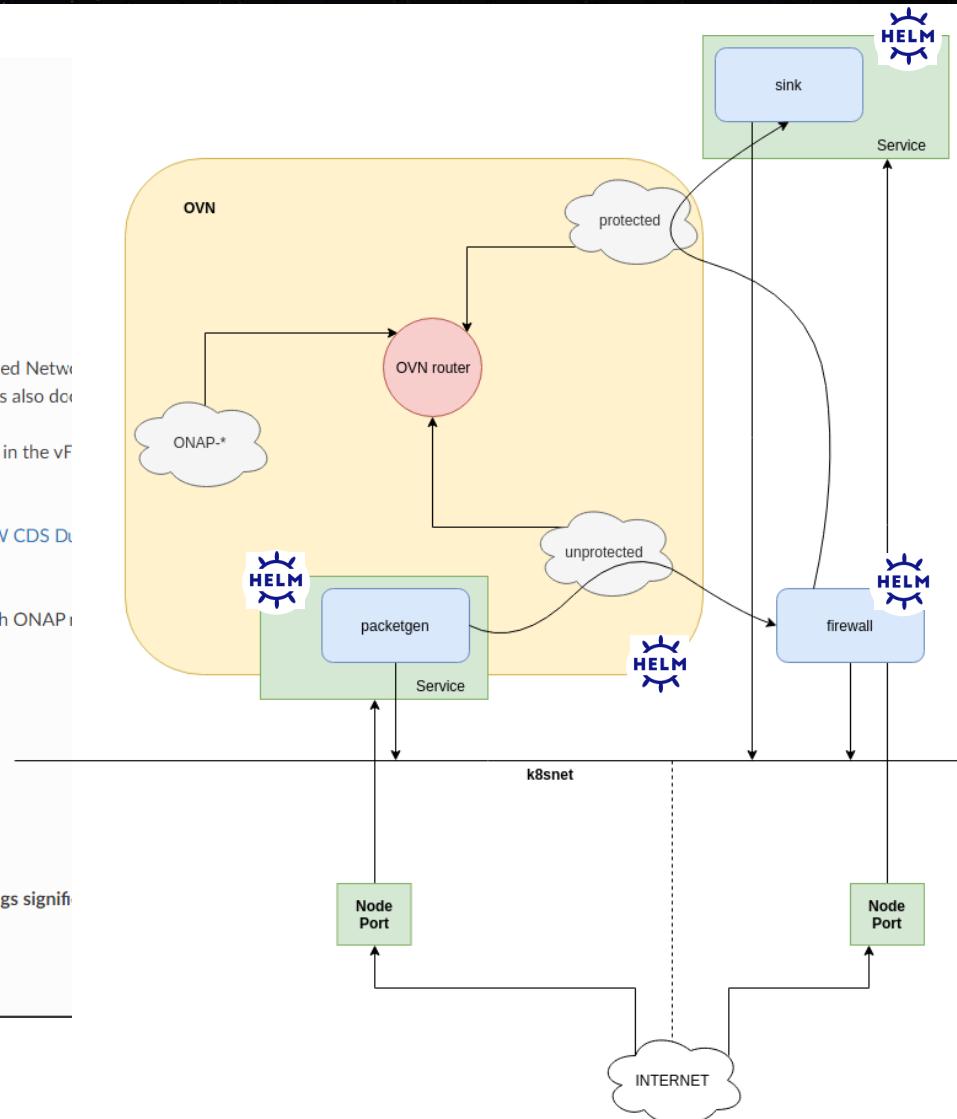

- vFW Kubernetes Helm charts support overrides (previously mostly hardcoded values)
- SDC accepts Onboarding Package with many helm packages what allows to keep decomposition of service instance similar to [vFW CDS Dublin](#)
- Compared to [vFW EDGEX K8S](#) use case MACRO workflow in SO is used instead of VNF a'la carte workflow
- No VNF data preloading used, instead resource-assignment feature of CDS is used
- CDS is used to resolve instantiation time parameters (Helm overrides) * IP addresses with IPAM * Unique names for resources with ONAP profile as part of instantiation flow
- Combined all models (Heat, Helm, CBA) in same git repo and a created single onboarding package [vFW_CNF_CDS Model](#)
- Use case does not contain Closed Loop part of the vFW demo.

All changes to related ONAP components and Use Case can be found in the following tickets:

- [REQ-182](#)
- [REQ-341](#)

Since Guilin ONAP supports Helm packages as a native onboarding artifacts and SO natively orchestrates Helm packages what brings significant improvements in terms of monitoring and management of the status of deployed CNF resources.

The vFW CNF Use Case
