EMCO controller to launch Temporal workflows at various life cycle management events

Topic Overview

A new controller is being added to EMCO to register and execute Temporal workflows on various lifecycle stages and events. For example before and after application installation, termination, update, before and after cluster registration, before and after logical cloud installation, termination, and update. Controller also provides management of workflows after installation like monitoring, status and cancellation of those workflows. In this presentation we'll go over the new API's and walk through an example event with Temporal support.
