Topic Description

45m, David Shur Yow-Jian Lin Rahul Jadhav

SEDIMENT (SEcure DIstributed IoT ManagemENT) uses a combination of software root of trust, remote attestation (RA), and resource-efficient cryptography, to build a security system that operates across the entire scales of IoT devices, with special emphasis on resource-constrained endpoints. The attestation, which appraises the integrity and trustworthiness of devices, can be integrated with the 5G ONAP AMF to control network/application access. An RA use case, with SEDIMENT RA Verifier and Relying Party being containerized and deployed with KubeArmor to enforce runtime security, will be discussed.

Topic Overview
